Script-Controlled ACL

Milestone 3: Creation of Access Control List – Read

Objective: Create a Script-Controlled Access Control List (ACL) that controls who can **read** records based on a scripted condition.

Step 1 – Open the ACL module

Log in to the ServiceNow instance. In the Application Navigator, search for **Access Control (ACL)** and open the ACL list.

Step 2 – Create a new ACL

Click **New** to create a new Access Control record.

Step 3 – Select the ACL type

Select the target **Table**, choose the required **Field** if field-level access is needed, and set **Operation = read**.

Step 4 – Enter the required role

In **Requires role**, select the role that should be allowed to pass the ACL. Use the custom role created for your project if applicable.

Step 5 – Enable the Script condition

In the **Script** section, enter logic that returns true when the current user is allowed to read the record and false when access should be denied.

Step 6 – Add the read-control script

Example:

```
answer = gs.hasRole('your_custom_role');
```

Replace **your_custom_role** with the actual role used in your project. Add record-specific conditions if required.

Step 7 – Save the ACL

Review the table, field, operation, role, and script. Click **Submit** or **Update** to save the ACL.

Step 8 – Test the Read ACL

Test with users having different roles. An authorized user should be able to read the protected record; an unauthorized user should be denied access.

Step 9 – Verify the result

Test User	Required Role	Expected Read Access
Authorized user	Has the required role	Allowed
Unauthorized user	Does not have the role	Denied

Expected Result

The Read ACL is successfully created. Access to the selected records is controlled by the configured role and script. Authorized users can read the records, while unauthorized users cannot.

Important Note

ACL evaluation depends on the table, field, operation, roles, conditions, and script configured in the instance. Use the exact table and custom role specified by your project requirements before testing.
