Script-Controlled ACL

Milestone 3: Creation of Access Control List – CREATE

Objective: Create a Script-Controlled Access Control List (ACL) that controls who can **create** records in the selected ServiceNow table.

Step 1 – Open Access Control (ACL)

Log in to the ServiceNow instance. In the Application Navigator, search for **Access Control (ACL)** and open the ACL list.

Step 2 – Create a new ACL

Click **New** to create a new Access Control record.

Step 3 – Select the target table

In the ACL form, select the table for which you want to control record creation. Use the table specified by your project requirements.

Step 4 – Select the operation

Set **Operation = create**. This makes the ACL control whether a user can create a new record in the selected table.

Step 5 – Configure the role

In **Requires role**, select the role that should be allowed to create records. If your project has a custom role, select that custom role.

Step 6 – Add the script condition

In the **Script** section, add a script that returns true for an authorized user and false for an unauthorized user.

Example Script

```
answer = gs.hasRole('your_custom_role');
```

Replace **your_custom_role** with the actual role used in your project.

Step 7 – Save the ACL

Check the table, operation, role, and script. Click **Submit** to create and save the ACL.

Step 8 – Test the CREATE ACL

Test the ACL with an authorized user and an unauthorized user. Try creating a new record from the protected table.

Step 9 – Verify the result

Test User	Required Role	Expected CREATE Access
Authorized user	Has the required role	Allowed
Unauthorized user	Does not have the role	Denied

Expected Result

The CREATE ACL is successfully created. Users who satisfy the configured role and script conditions can create records, while unauthorized users are prevented from creating records.

Conclusion

The Script-Controlled CREATE ACL provides controlled record creation based on the user's role and the script condition. This completes Milestone 3 – Creation of Access Control List (CREATE).

Important Note

Use the exact table and custom role specified in your project. ACL behavior can also depend on other applicable table, field, condition, and script ACLs.
