Milestone-2: Tables Creation

Step-by-Step Project Guide
This guide explains how to create the required tables in ServiceNow for the project.

Objective

Create the project tables with the required fields, verify the table definitions, and make sure the tables are ready for the Access Control List (ACL) milestones.

Action 1: Open the Table Creation Module

1. Log in to your ServiceNow instance with an account that has permission to create tables.
2. From the left-side Application Navigator, search for **Tables**.
3. Open **System Definition** → **Tables** (the exact menu name may vary slightly by ServiceNow version).
4. Click **New** to create a new table.

Action 2: Create the First Table

1. Enter the required **Label** for the first project table.
2. Check the automatically generated **Name** and confirm that it follows the required naming convention.
3. Add the required table description, if your project instructions specify one.
4. Configure the table options required by the project.
5. Add the required fields/columns in the **Columns** section.
6. For each field, select the correct field type such as String, Integer, Date/Time, Reference, Choice, or Boolean.
7. Enter the field label and any mandatory/default settings required by the project.
8. Click **Submit** or **Update** to save the table.

Action 3: Create the Second / Additional Table

1. Return to **System Definition** → **Tables**.
2. Click **New** again.
3. Enter the label and verify the generated table name.
4. Add the fields specified in the project requirement.
5. Check the field types, mandatory settings, and default values.
6. Save the table using **Submit**.
7. Repeat these steps if the milestone requires more than two tables.

Action 4: Verify the Tables

1. Open the newly created table from the Tables list.
2. Confirm that the table label and table name are correct.
3. Open the **Columns** section and verify every field.

4. Confirm that mandatory fields are marked correctly.
5. Confirm that reference fields point to the correct table, where applicable.
6. Open the table from the application/module used by your project and verify that records can be created.

Action 5: Final Checklist

Check	Status
Required table(s) created	■
Correct table label/name	■
All required fields added	■
Correct field types selected	■
Mandatory fields verified	■
Reference/choice fields verified	■
Tables saved successfully	■
Tables ready for Milestone-3 ACL creation	■

Milestone completion: After all required tables and fields are verified, the project can proceed to Milestone-3: Creation of Access Control List (ACL) – READ.

Note: Field names and the number of tables should match the exact requirements of your project/story. The screenshot provided identifies the milestone as "Milestone-2: Tables Creation".
